

FAQ's

How long should it take before I see results?

Normally you will see results immediately following the first treatment, while more visible changes will appear over the course of several weeks. More substantial results will become noticeable after 4-6 treatments (typically spaced 4-6 weeks apart). Your skin's condition will continue to improve over the span of 6-12 months, following a course of treatments, especially when combined with the recommended post-treatment care.

Is the treatment painful?

This depends on the treatment intensity. Vistapen treatments are relatively painless at lower needle depths; however the depth of the penetration is critical for optimal results.

Is there downtime after treatments?

Most patients are able to continue normal daily activities immediately following treatment. While this varies from patient to patient, some experience a degree of facial redness/irritation up to 24 hours post-procedure. The application of Secretly Ageless Growth Factor (GF) promptly after treatment will help accelerate the healing process and cover redness.

How much time is required between filler/muscle relaxant injections and Vistapen treatments?

It is important to let your clinician know of injectable treatments as they will be able to advise you on when is best to schedule your Vistapen treatment.

Check with your clinician before proceeding with Vistapen procedure if you are pregnant, using blood thinners, such as Warfarin, or if you are susceptible to keloiding skin. Do not treat over keloid scars, active problematic skin, such as severe solar keratosis, raised moles/warts, Rosacea, Eczema or Psoriasis.

Vistapen holds no responsibility for treatment outcomes. Individual results may vary. To be used only as directed.

After 2 treatments with Dr. Segal

Vistapen vs. Other Treatments More effective, comfortable treatment

Vistapen is simply a less invasive, non-surgical treatment strategically designed to reduce epidermal (skin) damage. Vistapen is made of two major parts: an electric hand-piece that plugs into a power source and a disposable needle consisting of 12 microscopic needles. The verticle needle orientation minimizes pain and discomfort traditionally experienced with dermal rollers. Providing a more comfortable micro-channeling treatment. Vistapen's ability to adjust the depth of its' needles allows for a custom treatment experience.

Why Vistapen?

Vistapen promotes skin rejuvenation through a non-surgical procedure known as Collagen Induction Therapy. This minimally-invasive treatment utilizes Vistapen: a device comprised of tiny needles that vertically puncture the skin and stimulate a wound-healing response within the body that encourage the body's natural healing responses through the production of new tissues. The micro-channels to the skin aid in the production of collagen and elastin. Results may be noticeable in just a few short treatments (6 is recommended for optimal results).

Dr. Segal of Cosmedical Spa reports the following results: Improved texture, skin firming, reduction of scars, stretch marks, minimized pore size.

Controlled injury can speed up the rejuvenation process substantially.

Medical professional, Dr. Segal, says Vistapen can be used to improve the look of the face, neck, chest, arms, hands, legs, abdomen and back.

Rejuvenation Results

Scarring before and after:

Vistapen can be as effective as ablative treatments such as fractional laser, IPL, laser resurfacing and chemical peels, without negative side effects and downtime.

Understanding your skin

Your skin is your number one defense against the environment. Your skin is the largest organ in your body and it is also the most abused. As we age, rejuvenation becomes a more extensive process.
